

SMART FILE ORGANIZER PRO

Internship Task

Task 1: Python Automation Script

Objective:

The objective of this project is to automate file organization using Python. The application categorizes files into

different folders based on their file extensions, reducing manual effort and improving file management.

Problem Statement:

Managing large numbers of files manually is time-consuming. Files such as images, documents, videos, and

spreadsheets often become scattered within a folder, making them difficult to locate.

Proposed Solution:

A Python-based automation script was developed to: Read files from a specified folder Identify file types based

on extensions Create category folders automatically Move files into their respective folders Generate a log file

for tracking operations .

Technologies Used Python

OSModule

Shutil Module

Datetime Module

System Workflow

User enters folder path.

Program scans all files.

File extensions are identified.

Required category folders are created.

Files are moved automatically.

Activity logs are generated.

Summary is displayed.

Features Implemented

Automatic file organization

Folder creation

File movement

Activity logging

File count summary

Error handling

Results:

The application successfully organized files into categorized folders and generated logs for all file movements.

Conclusion

The Smart File Organizer Pro project demonstrates practical Python automation skills and improves

productivity through automated file management.

Future Enhancements

GUI using Tkinter

Drag-and-drop functionality

Duplicate file detection

Cloud storage integration.
